

A compact test document for terminology-sensitive PDF translation.

This fixture references Attention Is All You Need as a paper title and Google Research as an organisation name. It uses ensemble models for sequence transduction and reports an English constituency parsing benchmark. The implementation applies Scaled Dot-Product Attention before Label Smoothing. These terms are deliberate regression targets and should not be translated word-for-word.

Protected formula region

```
scale = 1 / sqrt(d_k)
loss = cross_entropy + label_smoothing
```

The two formulas are printed in a monospace font so the existing protection rules have a deterministic source signal. Future region inventory code must also preserve formulas when font metadata is incomplete or conflicting.

Acceptance notes: preserve organisation names, preserve title casing where configured, retain formula glyphs, and produce a partial result rather than corrupting content that cannot be classified safely.

Vector attention visualisation

All labels are original fixture content - page 2 of 2

Figure 1. A vector graphic with English labels that must be preserved unless image translation is explicitly enabled.

The entire boxed area is a vector figure. A future region inventory must recognise it through drawing geometry and preserve all labels. This test guards against garbled text caused by applying prose translation to PDF glyph order inside a diagram.
